Vehicle gradual braking method - involves using control or
assigning electronic device designed to receive signal corresponding to
temperature limit and to keep constant logical signal for as long as
relevant temperature signal holds

Patent Assignee: WABCO GMBH (WESA)

Inventor: ECKERT H

Number of Countries: 027 Number of Patents: 004

Abstract (Basic): EP 885793 A

The method involves using the front axle brake (15) which as it reaches its load limit, a signal is received by the control (3) or assigning electronic device (17). One or several temperature sensors on the front axle brake, particularly the wheel brake (14), are connected with input to the control or assigning electronic device, to give off either continuous temperature or temperature limit signals.

The control or assigning electronic device is designed to receive a signal corresponding to the temperature limit and to keep constant the logical signal (SV) or the subsidiary signal (SR) or the front axle brake application energy signal (SEv) for as long as the relevant temperature signal holds or the braking operation lasts.

ADVANTAGE - Avoids the need for load sensors by regarding as its load signal a logical signal linked to the driver's action and subsequent braking force.
